

Practice Problems

The only way to get better at recognizing dynamic programming problems is through practice. The following problems all can be solved using dynamic programming. Give them a try:

1. <https://leetcode.com/problems/climbing-stairs/description/>
2. <https://leetcode.com/problems/maximum-subarray/description/>
3. <https://leetcode.com/problems/coin-change/description/>
4. <https://leetcode.com/problems/unique-paths/description/>
5. <https://leetcode.com/problems/triangle/description/>
6. <https://leetcode.com/problems/edit-distance/description/>
7. [And more!](#)

Start by understanding the recursive nature of these problems. Recall memoization and tabulation when tackling these recursive problems, especially tabulation for a bottom-up approach, since the solution to a larger problem depends directly on the solved smaller subproblems.
